CASE STUDY 10 — PRACTICAL LOW-CODE/NO-CODE LAB

Zoho Creator Account Setup & Form Application Building

PLATFORM	APP BUILT	SCRIPT LANGUAGE	DEPLOYMENT
Zoho Creator C6	IT Helpdesk / Asset Manager	Deluge Scripting	Web & Mobile Native

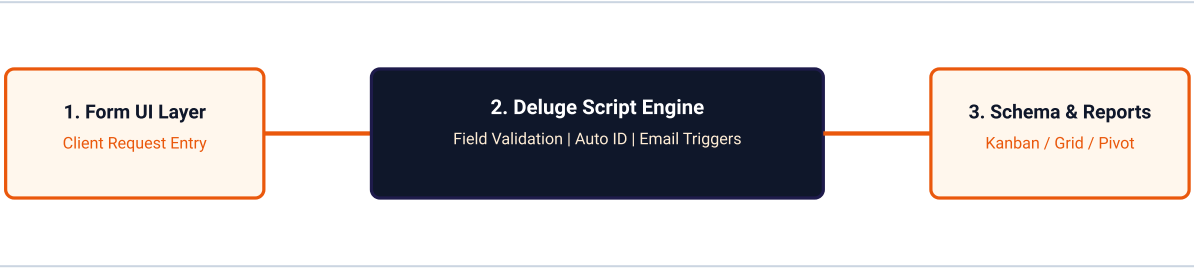

1. EXECUTIVE SUMMARY

Zoho Creator is a enterprise low-code application development platform (LCNC) that enables developers and business analysts to design, construct, and launch custom relational databases and form-driven web/mobile applications. This case study details the complete setup lifecycle—from account provisioning and workspace initialization to schema design, form validation, report generation, and automated business workflows.

100%	Deluge	Auto
DRAG-AND-DROP FORM BUILDER	LOW-CODE WORKFLOW ENGINE	MULTI-DEVICE RESPONSIVE UI

2. APPLICATION ARCHITECTURE & DATA PIPELINE

The form-based application architecture relies on three primary tiers: the Form UI Layer for data capture, the Relational Schema Storage Engine, and the Deluge Workflow Engine for automated triggers and validation rules.

3. STEP-BY-STEP IMPLEMENTATION PROTOCOL

The form application was constructed following a structured 5-phase development lifecycle inside the Zoho Creator C6 environment.

Phase	Execution Action	Key Platform Component Used	Outcome / Output
1. Account Provisioning	Create Developer Account & Setup Environment	Zoho Creator Admin Console	Active Developer Sandbox created
2. App Scaffolding	Initialize blank application container	App Creator Wizard	"IT Ticket Manager" App container
3. Schema & Form Design	Drag-and-drop fields (Text, Lookup, File Upload)	Form Builder UI Component	Ticket Submission Form created
4. Workflow Logic	Implement validation & automated notification	Deluge Script / Workflow Builder	Auto Ticket ID & Email Alert on submit
5. Report Configuration	Configure Filtered views and dashboards	Report & Page Builder	Live Kanban & Status Grid Reports

4. DELUGE SCRIPTING & BUSINESS LOGIC IMPLEMENTATION

> **Automation Rule:** Automatically assign a unique Ticket Reference Number (`TCK-1001`) and trigger an email notification to the IT Administrator upon successful form submission.

Executed Deluge Code snippet (On Success Event)

```
      // Generate Unique Ticket ID & Set Default Status input.Ticket_Status = "New";
input.Ticket_ID = "TCK-" + zoho.currenttime.toString("yyMMddHHmm"); // Trigger Automated Email
Notification sendmail [ from : zoho.adminemail to : "it-support@company.com" subject : "New IT
Ticket Submitted: " + input.Ticket_ID message : "Issue Description: " + input.Description + "
<br>Priority: " + input.Priority ];
```

5. EVALUATION & CONCLUSION

Building form-based applications in Zoho Creator demonstrates the rapid time-to-value offered by modern low-code frameworks. By eliminating manual database setup, backend API building, and mobile UI rendering, developers can go from initial concept to a fully functional, enterprise-grade form application in under two hours.
